How Does Cannabis Work?

The active ingredients in cannabis act on specified receptors called cannabinoid receptors, that are located throughout the body. Research studies have shown that these receptors control various symptoms including pain, inflammation, sleep/wake cycle, metabolism, and much more. The medicine from the plant comes from appendages known as trichomes on the outside of the leaves.

Main Properties of Medical Cannabis

Cannabidiol
(CBD)

Tetrahydrocannabinol
(THC)

CBD is Non-psychoactive (non-intoxicating) compound. CBD helps to reduce inflammation, relieve anxiety and pain, treat seizures, improve sleep quality, and more.

THC is the psychoactive compound and potency depends on the THC percentage level. THC helps treat pain, PTSD, anxiety, depression, sleep issues, and more.

Methods Of Consumption

Oils & Ingestibles

- Oils & Sprays
- Softgel capsules
- Edibles (Chocolates & Gummies)

Oils and ingestibles are slower acting and offer long-lasting relief (up to 12 hours or more). This category offers precise dosing and discreet consumption.

Inhalation & Vaporization

- Dry flower
- Pre-filled cartridges
- Prerolls
- Concentrates

Inhalation and vaporization are fast-acting relief for 4 hours or more. Used for onset symptoms such as PTSD, migraines, or pain.

Topicals

Fast absorbing lotions and creams with cannabis extracts applied directly to the skin.
